

*Engineering Center*

*Built by Harmon* is a well known expression on today's OU campus. Three buildings which were dedicated in 1965 during the University's 75th anniversary observance are reasons why. First there's the impressive Engineering Center, which dominates the entrance to the campus at the intersection of Boyd and Asp. On the South Oval is the attractive and marvelously efficient nine-story Botany and Microbiology Building which helps the University maintain a leading position in this field. And then there's the towering Adams Center, tallest construction on the campus. Composed of four 12-story units connected at ground level by a central cafeteria, the housing complex is coeducational and accommodates 1,000 students. Builders, architects, and university planners from all over the nation have been frequent visitors at OU to observe these pace-setting buildings constructed by Harmon. All have received wide recognition for their combination of quality and efficiency at comparatively low cost. Harmon is proud to be a part of the forward looking University of Oklahoma campus.
